

Timberframes are hand carved off-site using old world mortise and tenon joinery with hardwood pegs. Choose from standard designs, or have a custom frame created with your architect or builder. Pairing a timberframe with SIPs (Structural Insulated Panels) creates a home that surpasses almost any structure in strength and efficiency. Timberframes can also cut down on "dry in" times since the structure is fitted off-site and erected on-site. A timberframe could be an entire home or used to add an element to your new home or remodel. Porches, awnings, great rooms, structural beams (to replace load bearing walls for an open floorplan) are just a few ways to incorporate timberframing into a home or business.

Choose to create an indoor or outdoor space that is efficient, functional, and has enduring beauty.
